

Video Modeling to Increase Independence in Students with Disabilities

The use of video modeling for students with disabilities is an evidence based practice that shows promising results for instruction in the areas of social skills, behavior, and classroom and community skills. We invite you to join us in exploring its benefits and possibilities across a variety of tasks and activities.

In this work session we will explore and share different ways to use the Flip camera and video modeling to support independent performance for individuals with disabilities in a wide variety of tasks. During this training, participants will create self-designed video prompts for their students or family members. Participants will leave this training with the ability to design and use video modeling in their classroom.

Presented by:
Dr. Kate Mitchem & Renae Kotchman

Cost \$25.00, includes lunch

Time 9-3

Register by going to:
